

String Methods

Method	Description
<u>capitalize()</u>	Converts the first character to upper case
<u>casefold()</u>	Converts string into lower case
<u>center()</u>	Returns a centered string
<u>count()</u>	Returns the number of times a specified value occurs in a string
<u>encode()</u>	Returns an encoded version of the string
<u>endswith()</u>	Returns true if the string ends with the specified value
<u>expandtabs()</u>	Sets the tab size of the string
<u>find()</u>	Searches the string for a specified value and returns the position of where it was found
<u>format()</u>	Formats specified values in a string
<u>format_map()</u>	Formats specified values in a string
<u>index()</u>	Searches the string for a specified value and returns the position of where it was found
<u>isalnum()</u>	Returns True if all characters in the string are alphanumeric
<u>isalpha()</u>	Returns True if all characters in the string are in the alphabet
<u>isdecimal()</u>	Returns True if all characters in the string are decimals
<u>isdigit()</u>	Returns True if all characters in the string are digits
<u>isidentifier()</u>	Returns True if the string is an identifier
<u>islower()</u>	Returns True if all characters in the string are lower case
<u>isnumeric()</u>	Returns True if all characters in the string are numeric
<u>isprintable()</u>	Returns True if all characters in the string are printable
<u>isspace()</u>	Returns True if all characters in the string are whitespaces
<u>istitle()</u>	Returns True if the string follows the rules of a title

<u>isupper()</u>	Returns True if all characters in the string are upper case
<u>join()</u>	Joins the elements of an iterable to the end of the string
<u>ljust()</u>	Returns a left justified version of the string
<u>lower()</u>	Converts a string into lower case
<u>lstrip()</u>	Returns a left trim version of the string
<u>maketrans()</u>	Returns a translation table to be used in translations
<u>partition()</u>	Returns a tuple where the string is parted into three parts
<u>replace()</u>	Returns a string where a specified value is replaced with a specified value
<u>rfind()</u>	Searches the string for a specified value and returns the last position of where it was found
<u>rindex()</u>	Searches the string for a specified value and returns the last position of where it was found
<u>rjust()</u>	Returns a right justified version of the string
<u>rpartition()</u>	Returns a tuple where the string is parted into three parts
<u>rsplit()</u>	Splits the string at the specified separator, and returns a list
<u>rstrip()</u>	Returns a right trim version of the string
<u>split()</u>	Splits the string at the specified separator, and returns a list
<u>splitlines()</u>	Splits the string at line breaks and returns a list
<u>startswith()</u>	Returns true if the string starts with the specified value
<u>strip()</u>	Returns a trimmed version of the string
<u>swapcase()</u>	Swaps cases, lower case becomes upper case and vice versa
<u>title()</u>	Converts the first character of each word to upper case
<u>translate()</u>	Returns a translated string
<u>upper()</u>	Converts a string into upper case
<u>zfill()</u>	Fills the string with a specified number of 0 values at the beginning

Set Methods

Method	Description
<code>add()</code>	Adds an element to the set
<code>clear()</code>	Removes all elements from the set
<code>copy()</code>	Returns a copy of the set
<code>difference()</code>	Returns the difference of two or more sets as a new set
<code>difference_update()</code>	Removes all elements of another set from this set
<code>discard()</code>	Removes an element from the set if it is a member. (Do nothing if the element is not in set)
<code>intersection()</code>	Returns the intersection of two sets as a new set
<code>intersection_update()</code>	Updates the set with the intersection of itself and another
<code>isdisjoint()</code>	Returns <code>True</code> if two sets have a null intersection
<code>issubset()</code>	Returns <code>True</code> if another set contains this set
<code>issuperset()</code>	Returns <code>True</code> if this set contains another set
<code>pop()</code>	Removes and returns an arbitrary set element. Raise <code>KeyError</code> if the set is empty
<code>remove()</code>	Removes an element from the set. If the element is not a member, raise a <code>KeyError</code>
<code>symmetric_difference()</code>	Returns the symmetric difference of two sets as a new set
<code>symmetric_difference_update()</code>	Updates a set with the symmetric difference of itself and another
<code>union()</code>	Returns the union of sets in a new set
<code>update()</code>	Updates the set with the union of itself and others

List Methods

Method	Description
<code>append()</code>	Adds an element at the end of the list
<code>clear()</code>	Removes all the elements from the list
<code>copy()</code>	Returns a copy of the list
<code>count()</code>	Returns the number of elements with the specified value
<code>extend()</code>	Add the elements of a list (or any iterable), to the end of the current list
<code>index()</code>	Returns the index of the first element with the specified value
<code>insert()</code>	Adds an element at the specified position
<code>pop()</code>	Removes the element at the specified position
<code>remove()</code>	Removes the item with the specified value
<code>reverse()</code>	Reverses the order of the list
<code>sort()</code>	Sorts the list

Tuple Methods

Method	Description
<code>count()</code>	Returns the number of times a specified value occurs in a tuple
<code>index()</code>	Searches the tuple for a specified value and returns the position of where it was found

Dictionary Methods

Method	Description
<code>clear()</code>	Remove all items form the dictionary.
<code>copy()</code>	Return a shallow copy of the dictionary.
<code>fromkeys(seq[, v])</code>	Return a new dictionary with keys from <code>seq</code> and value equal to <code>v</code> (defaults to <code>None</code>).
<code>get(key[, d])</code>	Return the value of <code>key</code> . If <code>key</code> doesnot exit, return <code>d</code> (defaults to <code>None</code>).
<code>items()</code>	Return a new view of the dictionary's items (key, value).
<code>keys()</code>	Return a new view of the dictionary's keys.
<code>pop(key[, d])</code>	Remove the item with <code>key</code> and return its value or <code>d</code> if <code>key</code> is not found. If <code>d</code> is not provided and <code>key</code> is not found, raises <code>KeyError</code> .
<code>popitem()</code>	Remove and return an arbitrary item (key, value). Raises <code>KeyError</code> if the dictionary is empty.
<code>setdefault(key[, d])</code>	If <code>key</code> is in the dictionary, return its value. If not, insert <code>key</code> with a value of <code>d</code> and return <code>d</code> (defaults to <code>None</code>).
<code>update([other])</code>	Update the dictionary with the key/value pairs from <code>other</code> , overwriting existing keys.
<code>values()</code>	Return a new view of the dictionary's values
